

## Bucket Type Milking System:

With the Bucket System, the bucket is under vacuum and milk is conveyed in to the bucket from the milking unit connected to the animal. After each animal is milked, the milk is then poured from the bucket in to the bulk cooler after weighing and recording the data in logbook or computer.

Vacuum for the bucket unit is supplied by a vacuum line, which is installed in the barn. Vacuum line has tapping at several points as per Vacuum pump design where Milking machine can be connected.

For Milking machine accessories pl. refer attached drawing.:
